

DISCLAIMER

I have myself written the whole code except the dynamically changing text which u can see on the home page. For the dynamically changing text I used a JavaScript script from internet.

BUGS

- The dynamically changing text gets stopped when I change page and come back to home page again.
- In about page at the bottom the page height is somehow not sufficient, u can see a white section at the bottom when screen width is changed. I couldn't figure out what was going on
- At last I tried my best to create responsive website.

SOME BASIC FEATURES OF SITE

- I have made dark and light mode toggle button themes, it stores the state in local storage which can be used for reference, and the theme if changed continues even when u load other pages on site. The button have fixed position
- I have used react-router-dom to prevent page reloading when switching pages
- The side bar is disabled when screen width is below 920 px
- In **My Works page** the buttons – { **Design, Webdev, Photography** } works when you click on one of them then only the selected images for designed are shown, and for every other things respectively. When none of the button is selected then all images are shown
